Traffic Data Management Software (DOS) - TrafMan

Overview

TrafMan has been the standard in traffic data management for over 20 years. From remote Counter programming to custom reporting and data management, TrafMan is a full software suite that offers great flexibility and robust features.

TrafMan is fully compatible with most Diamond Traffic counters / classifiers and even imports data from some other brand classifiers. From programming counters remotely (via telemetry software) to downloading files, TrafMan includes all aspects of counter communication.

Once data has been retrieved, the database imports all data types (Sensor, Raw Per-vehicle, Binned Classification, Volume Count) and stores them by their Site Identification. A complete editing and viewing toolset is available with data integrity checking to ensure no bad or lost data has occurred. File and text editing is also included with data type conversion utilities selectable upon import or at the users convenience.

With over 10 custom export and 20 printing formats, TrafMan is flexible in data reporting. A number of options are available to make sure you only get the data you want, giving you customized settings to be remembered by the software later.

Works with Diamond Counters/Classifiers Full data editing and conversions Online Help (context sensitive)
Software customizable preferences Fully compatible with all versions of Windows® 95/98, ME, NT, 2000, XP
