Centurion Version History 1.01

Build #0001 08/21/02	Updated all VCL component libraries to fix bugs and improve system operation. Changed the registration system to work through an FTP firewall in "Open" configuration. Users of V1.00 are automatically registered & licensed for V1.01 if they have a current license for V1.00 (no additional information sent to DET). Fixed problem with manual registrations not accepting Authorization code from DET help desk. Reorganized the Registration dialog to make it easier to read and fill out. Fixed misspellings on Per-Vehicle flow report. Changed import system to make sure all new imports are posted after each counter file to prevent missing database data in case of problem. Changed import to check for key violations prior to posting ANY volume, classification, or per-vehicle record during the import process. Fixed problem with windows being inaccessible under toolbar. Fixed problem with not immediately changing database directories when user chooses new path.
