

## Diamond Knowledge Base

### Centurion Version History 1.06

1.06 02/09/03	Program now checks for and prevents multiple copies of Centurion from running on the same machine. Greatly improved support for long file names and directories. Database locations should still be kept in relatively short paths until Centurion-DB is available. All database aliases now handled directly by Centurion. No need to use the BDE Admin tool at anytime (shortcut has been eliminated from the Start Menu). Added two new check boxes to the Counter Preferences: Auto Erase Flash and Auto Erase MMC. These boxes tell Centurion if you want to automatically erase Flash or MMC memory when download is complete. Fixed some file naming problems with the Bin Table editor and Windows 2000. Removed the Install password requirement. Fixed problem when exporting multiple sites and one or more site has no data to export in it (causing Centurion to hang). Changed the default Export Date/Time range to use the widest range when selected sites do not overlap anywhere. Export to Excel is grayed out when Excel not installed on the computer.
