Centurion Version History 1.25

Build #0001 10/28/04	Full commercial release of changes made in 1.24. In addition, version 1.25 contains several new features listed below: Added the Peek Monthly Export Format. Complete support for programming & monitoring Sprite Counters. Added new Volume report: Yearly Site Summary. Added Import New to the main menu.
Build #0002 11/09/04	Fixed problem importing certain Datahog Data that was polled from Unicorn-Limited or Apollo counters.
Build #0003 11/29/04	Added support for GPS (Global Positioning System) ability to V1.40 Unicorn-Limited and Apollo units. Reports not list the Longitude and Latitude (if collected) at the top of the first page. During importing, a check is automatically made to war you if the GPS location for the same site is different by more than 0.01 seconds. Also made the following changes and corrections: Added slight delay to all counter string commands (fixes password problem in MDK and other issues). Changed to allow setting the end time of the final In-Day period to zero (to allow full day to be covered) on counters supporting In-Day times. Parking lot system now allows "Open/Full" to be displayed (instead of the number of spaces left). Fixed problem with sub-tables not being redrawn when view window is minimized and then restored (now will automatically unexpand). Changed to 24 hour format on Site Setup screen. Fixed problem not creating Volume data from a SpeedxAxle or SpeedxLength table during import. Fixed not showing footer on Basic Volume (60) report.
